

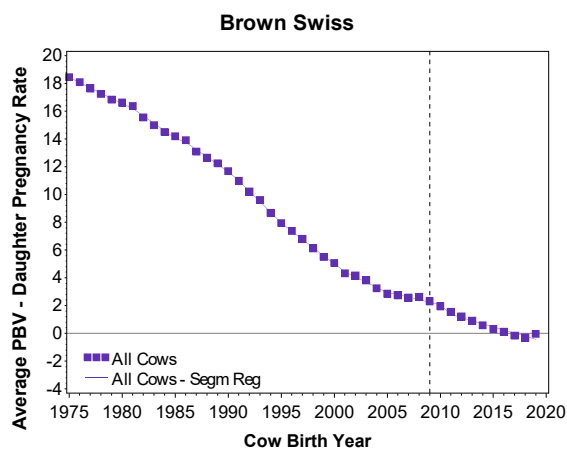

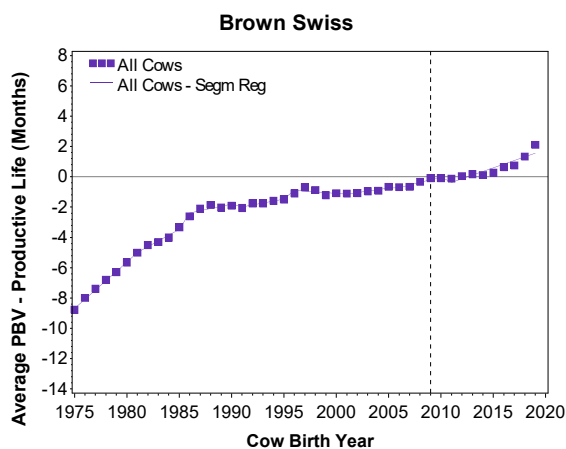

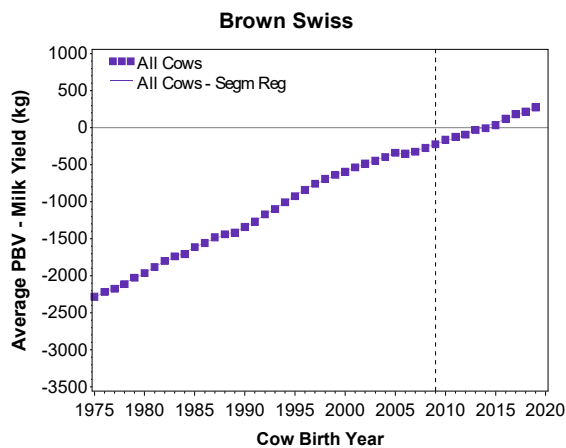

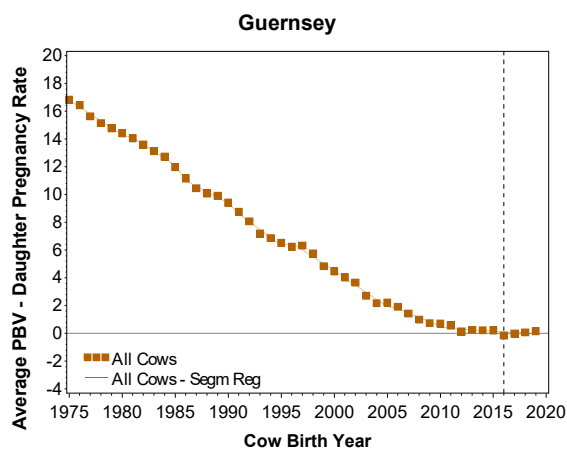

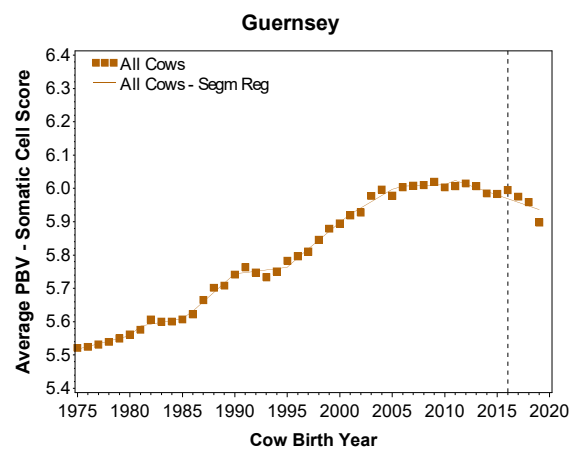

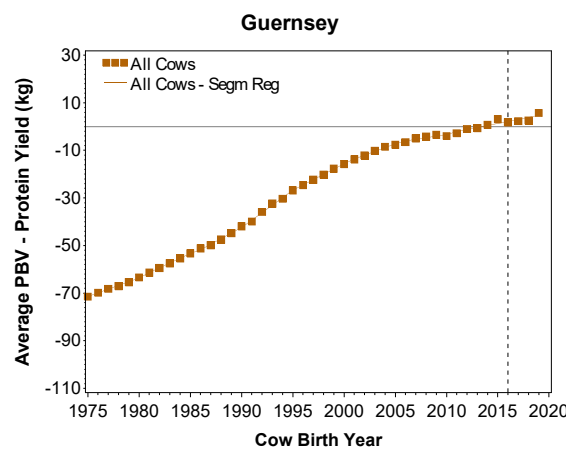

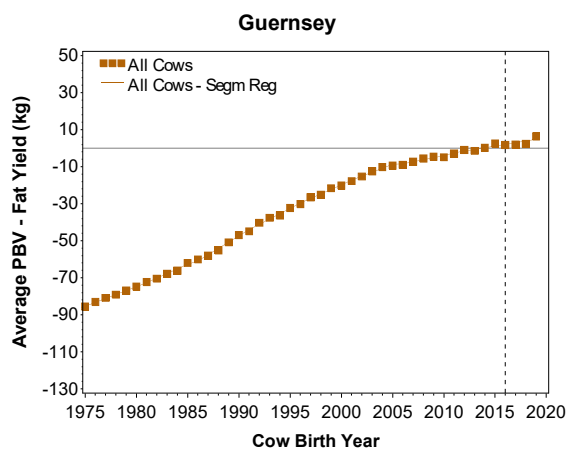

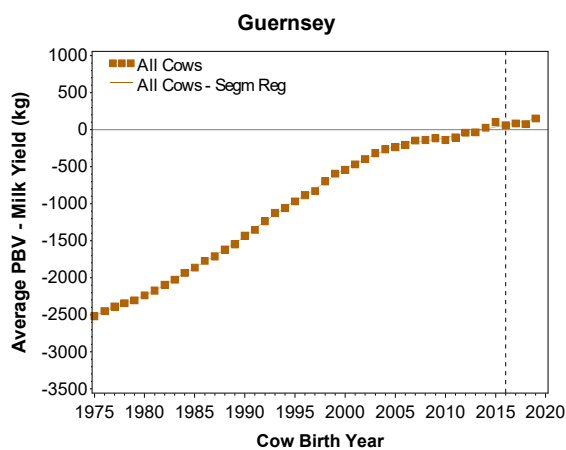

**Figure S1.** Estimates of genetic change per year from segmented regressions of  $\overline{PBV}$  on birth year for AY cows for seven traits: milk, fat, and protein yields; SCS; PL; DPR and LIV. The vertical dashed line indicates the year when genomic selection was implemented (i.e., 2013).

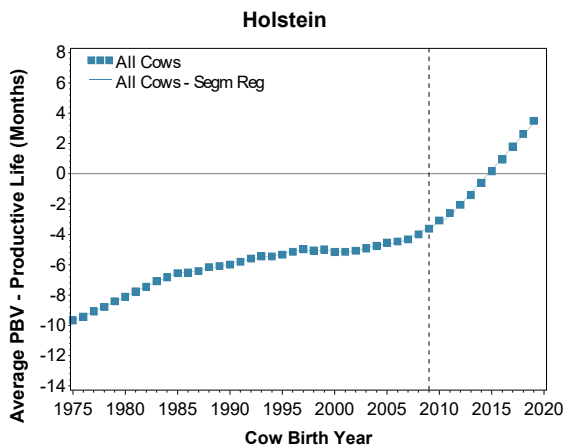

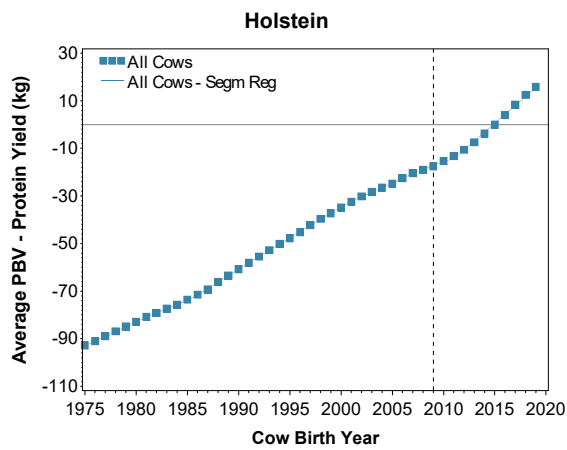

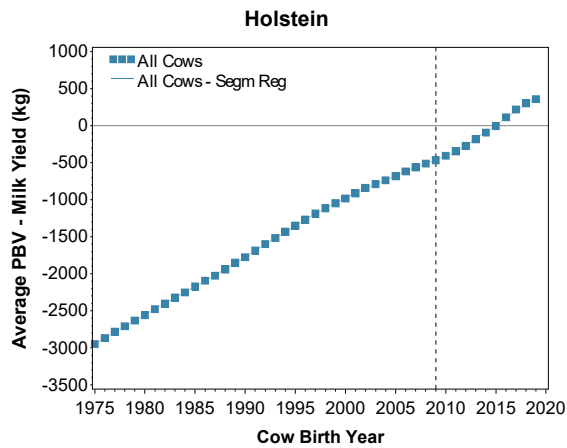

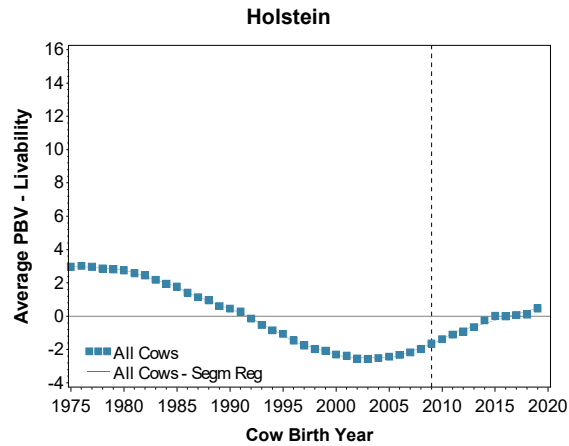

**Figure S2.** Estimates of genetic change per year from segmented regressions of  $\overline{PBV}$  on birth year for BS cows for seven traits: milk, fat, and protein yields; SCS; PL; DPR and LIV. The vertical dashed line indicates the year when genomic selection was implemented (i.e., 2009).

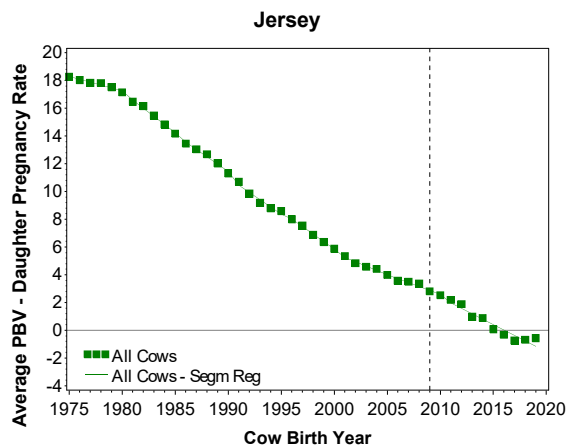

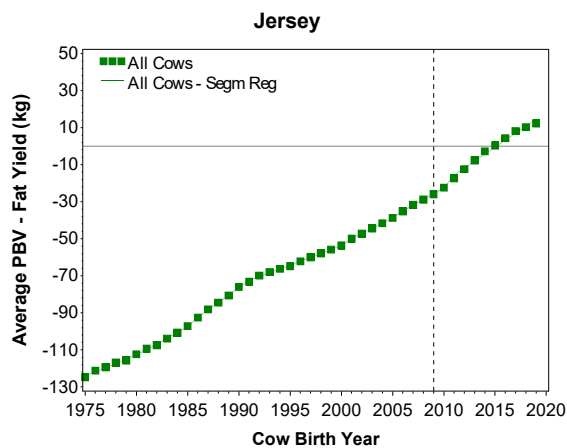

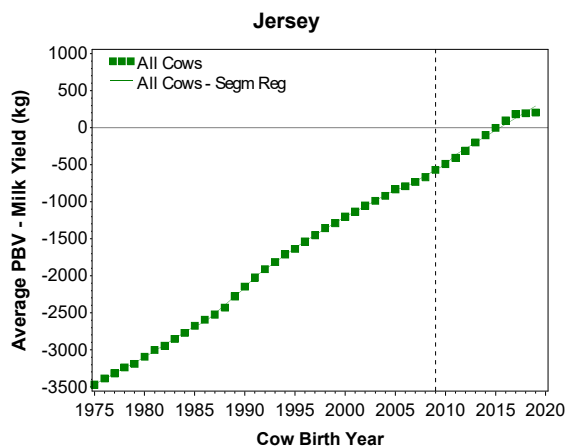

**Figure S3.** Estimates of genetic change per year from segmented regressions of  $\overline{PBV}$  on birth year for GU cows for seven traits: milk, fat, and protein yields; SCS; PL; DPR and LIV. The vertical dashed line indicates the year when genomic selection was implemented (i.e., 2016).

**Figure S4.** Estimates of genetic change per year from segmented regressions of  $\overline{PBV}$  on birth year for HO cows for seven traits: milk, fat, and protein yields; SCS; PL; DPR and LIV. The vertical dashed line indicates the year when genomic selection was implemented (i.e., 2009).

**Figure S5.** Estimates of genetic change per year from segmented regressions of  $\overline{PBV}$  on birth year for JE cows for seven traits: milk, fat, and protein yields; SCS; PL; DPR and LIV. The vertical dashed line indicates the year when genomic selection was implemented (i.e., 2009).
